

Interim Report by Davina Arrieta and Jennifer Lopez

2/21/17 3:05 PM

Our problem is high pollen count and allergies/attacks. Our plan is to track and log our data on high pollen counts and how it effects the lungs of an allergic person. We will use this data to show the negative affects of allergies and the positive impact we can have on pollen awareness. As of right now we have near completed our project poster, have started on all 3 of our codes and are planning on making an app that uses the photo of a plant to identify the pollen count and the genus/species. As a result we hope to raise pollen/allergy awareness and help those who have allergies identify what they may be allergic to plant wise. We have used information from a website called www.pollen.com/help/faq and www.verywell.com
