

Celia Mind Control Institution Project Proposal

What will Newmexico look like in 1000 years? Will people be able to adapt to a change in the terrain? The Look of Life project is supposed to help predict the probable terrain shape in the near, and then farther out future. The way we plan to achieve this task is by taking into account factors such as native plant life in the area, humidity levels, rock types weather patterns ect. One major theme is that variables will affect each other and be interrelated, for example, if there is a lot of rain in the area, there will be an increase erosion, but there would also be an increase in plant life so despite the rain it would be unlikely for canyons to form.
